
Annual Water Quality Report

Water testing performed in 2006

Proudly Presented By:

City of Leesburg

PWS ID#: 3350745,3351566

Continuing Our Commitment

Once again we proudly present our annual water quality report. This edition covers all testing completed from January 1, 2006 through December 31, 2006. We are pleased to tell you that our compliance with all state and federal drinking water laws remains exemplary. As in the past, we are committed to delivering the best-quality drinking water. To that end, we remain vigilant in meeting the challenges of source water protection, water conservation, and community education while continuing to serve the needs of all of our water users.

For more information about this report, or for any questions relating to your drinking water, please call Al Purvis, Chief Water Operator, at (352) 728-9835, or visit our Web site at www.ci.leesburg.fl.us.

Source Water Assessment

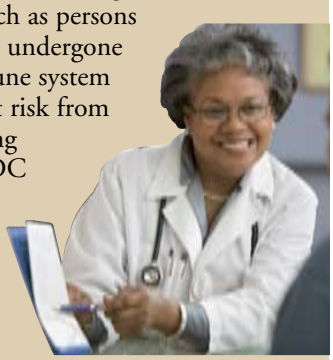
In 2004 the Department of Environmental Protection performed a Source Water Assessment on our system. The assessment was conducted to provide information about any potential sources of contamination in the vicinity of our wells (or surface water intakes). There are eight potential sources of contamination identified for the City's main system with moderate to high susceptibility levels, and the East system has two potential sources of contamination with moderate to high susceptibility levels. The assessment results are available on the Florida Department of the Environment (FDEP) Source Water Assessment and Protection Program Web site at www.dep.state.fl.us/swapp.

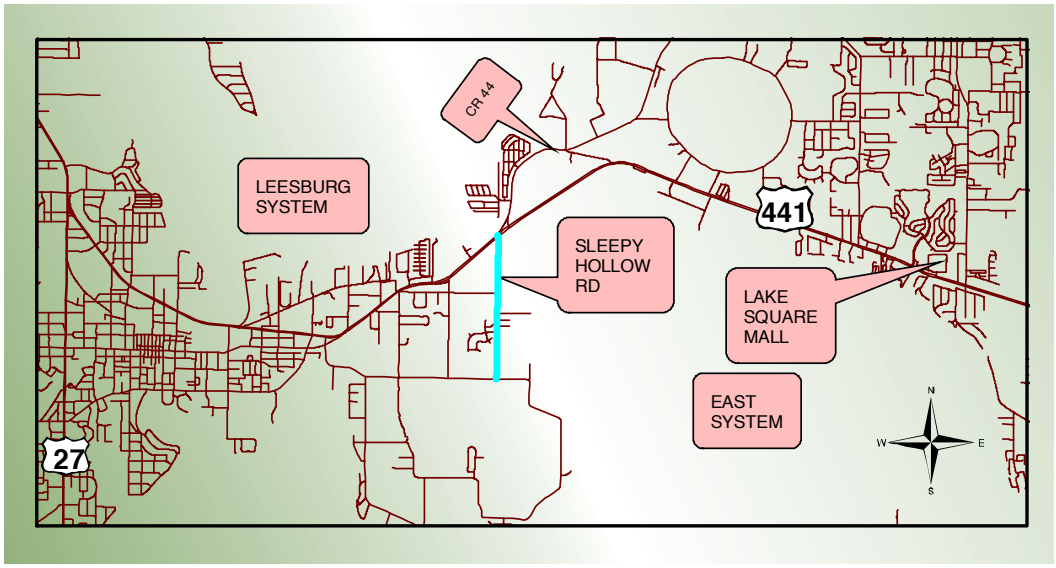
How Is My Water Treated and Purified?

Chlorine, in gas form, is added as a precaution against any bacteria that may be present. (We carefully monitor the amount of chlorine, adding the smallest quantity necessary to protect the safety of your water without compromising taste.)

Important Health Information

Some people may be more vulnerable to contaminants in drinking water than the general population. Immunocompromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants may be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. The U.S. EPA/CDC (Centers for Disease Control and Prevention) guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline at (800) 426-4791.





Radon

Radon is a radioactive gas that occurs naturally in some groundwater. It may pose a health risk when the gas is released from water into air, as occurs during showering, bathing, or washing dishes and clothes. Radon gas released from drinking water is a relatively small part of the total radon in air. Radon is released into homes and groundwater from soil. Inhalation of radon gas has been linked to lung cancer; however, the effects of radon ingested in drinking water are not yet clear. If you are concerned about radon in your home, tests are available to determine the total exposure level. For additional information on how to have your home tested, call (800) SOS-RADON.

Where Does My Water Come From?

Our source of supply for both the City of Leesburg's main and East water systems is groundwater taken from the Floridan Aquifer within the Oklawaha watershed. Chlorination is used for disinfection purposes in both water systems.

The City of Leesburg's main water treatment plant has eight deep wells ranging in depth from 250 feet to 950 feet and is located within the city limits. The City of Leesburg has 3.7 million gallons of storage capacity with more than 163 miles of distribution water mains. This main water system serves 9,182 meter connections representing an estimated population of 32,137 customers.

The East system, consisting of the mall and airport water treatment plants, presently has two deep wells ranging in depth from 366 feet to 555 feet. The East system has 160,000 gallons of storage capacity with more than 85 miles of distribution water mains. This system serves 2,544 meter connections representing an estimated population of 8,904 customers.

To learn about your watershed on the Internet, go to the U.S. EPA's Surf Your Watershed Web site at www.epa.gov/surf.

Substances That Might Be in Drinking Water

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include:

Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.

Inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.

Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.

Organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, and septic systems.

Radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, the U.S. EPA prescribes regulations, which limit the amount of certain contaminants in water provided by public water systems. The Food and Drug Administration (FDA) regulations establish limits for contaminants in bottled water, which must provide the same protection for public health.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the U.S. Environmental Protection Agency's Safe Drinking Water Hotline at (800) 426-4791.

Naturally Occurring Bacteria

The simple fact is, bacteria and other microorganisms inhabit our world. They can be found all around us: in our food; on our skin; in our bodies; and, in the air, soil, and water. Some are harmful to us and some are not. Coliform bacteria are common in the environment and are generally not harmful themselves. The presence of this bacterial form in drinking water is a concern because it indicates that the water may be contaminated with other organisms that can cause disease. Throughout the year we tested for coliform bacteria. In that time, none of the many samples taken came back positive for the bacteria. Federal regulations now require that public water that tests positive for coliform bacteria must be further analyzed for fecal coliform bacteria. Fecal coliform are present only in human and animal waste. Because these bacteria can cause illness, it is unacceptable for fecal coliform to be present in water at any concentration. Our tests indicate no fecal coliform is present in our water.

Community Participation

You are invited to participate in our city commission meetings and voice your concerns about your drinking water. We meet on the third floor of City Hall on the second and fourth Monday of each month beginning at 5:00 p.m. City Hall is located at 501 West Meadow Street in Leesburg.

Sampling Results

During the past year we have taken hundreds of water samples in order to determine the presence of any radioactive, biological, inorganic, volatile organic, or synthetic organic contaminants. The table below shows only those contaminants that were detected in the water. Although all of the substances listed here are under the Maximum Contaminant Level (MCL), we feel it is important that you know exactly what was detected and how much of the substance was present in the water.

The state allows us to monitor for certain substances less than once per year because the concentrations of these substances do not change frequently. In these cases, the most recent sample data are included, along with the year in which the sample was taken.

PRIMARY REGULATED CONTAMINANTS

		City of Leesburg			East (Mall)			East (Airport)					
CONTAMINANT AND UNIT OF MEASUREMENT	MCL VIOLATION (YES/NO)	DATE OF SAMPLING (MO./YR.)	LEVEL DETECTED[1]	RANGE OF RESULTS	DATE OF SAMPLING (MO./YR.)	LEVEL DETECTED[1]	RANGE OF RESULTS	DATE OF SAMPLING (MO./YR.)	LEVEL DETECTED[1]	RANGE OF RESULTS	MCLG	MCL	LIKELY SOURCE OF CONTAMINATION
Radiological Contaminants													
Alpha Emitters (pCi/L)	No	3/2002	1.0	NA	3/2002	1.0	NA	7/2002	1.1	NA	0	15	Erosion of natural deposits
Radium 226 + 228 [Combined Radium] (pCi/L)	No	2/2003	1.8	NA	2/2003	1.1	NA	3/2003	0.8	NA	0	5	Erosion of natural deposits
Inorganic Contaminants													
Fluoride (ppm)	No	2/2005	0.100	NA	NA	NA	NA	3/2005	0.092	NA	4	4.0	Erosion of natural deposits; water additive which promotes strong teeth; discharge from fertilizer and aluminum factories
Nitrate [as Nitrogen] (ppm)	No	1/2006	0.676	NA	1/2006	0.011	NA	1/2006	0.022	NA	10	10	Runoff from fertilizer use; leaching from septic tanks, sewage; erosion of natural deposits
Sodium (ppm)	No	2/2005	5.1	NA	4/2005	4.9	NA	3/2005	4.8	NA	NA	160	Salt water intrusion, leaching from soil

TTHMs and Stage 1 Disinfectant/Disinfection By-Product (D/DBP) Contaminants

		City of Leesburg			East (Mall)			East (Airport)					
CONTAMINANT AND UNIT OF MEASUREMENT	MCL VIOLATION (YES/NO)	DATE OF SAMPLING (MO./YR.)	LEVEL DETECTED[2]	RANGE OF RESULTS[2]	DATE OF SAMPLING (MO./YR.)	LEVEL DETECTED[2]	RANGE OF RESULTS[2]	DATE OF SAMPLING (MO./YR.)	LEVEL DETECTED[2]	RANGE OF RESULTS[2]	MCLG OR [MRDLG]	MCL OR [MRDL]	LIKELY SOURCE OF CONTAMINATION
Chlorine (ppm)	No	1-12/2006	1.40	0.90–1.98	1-12/2006	1.42	1.00–1.90	1-12/2006	1.42	1.00–1.90	[4]	[4.0]	Water additive used to control microbes
Haloacetic Acids (five) [HAA5] (ppb)	No	7/2006	12.24	NA	NA	NA	NA	7/2005	12.48	NA	NA	60	By-product of drinking water disinfection
TTHM [Total	No	7/2006	8.45	NA	7/2005	15.4	NA	7/2005	14.98	NA	NA	80	By-product of drinking water disinfection

Lead and Copper (Tap water samples were collected from sites throughout the community)

		City of Leesburg			East (Mall and Airport)					
CONTAMINANT AND UNIT OF MEASUREMENT	AL VIOLATION (YES/NO)	DATE OF SAMPLING (MO./YR.)	90TH PERCENTILE RESULT	NO. OF SAMPLING SITES EXCEEDING THE AL	DATE OF SAMPLING (MO./YR.)	90TH PERCENTILE RESULT	NO. OF SAMPLING SITES EXCEEDING THE AL	MCLG	AL (ACTION LEVEL)	LIKELY SOURCE OF CONTAMINATION
Copper [tap water] (ppm)	No	6/2005	0.23	0	6/2005	0.155	0	1.3	1.3	Corrosion of household plumbing systems; erosion of natural deposits; leaching from wood preservatives
Lead [tap water] (ppb)	No	6/2005	5	0	NA	NA	NA	0	15	Corrosion of household plumbing systems, erosion of natural deposits

[1] Results in the Level Detected column for radiological and inorganic contaminants are the highest average at any of the sampling points or the highest detected level at any sampling point, depending on the sampling frequency.

[2] The Level Detected is the annual average of the quarterly averages chlorine haloacetic acids, and total trihalomethanes (MCL 80 ppb). The Range of Results column shows the range of results (lowest to highest) at the individual sampling sites, including IDSE results.

Table Definitions

AL (Action Level): The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

MCL (Maximum Contaminant Level): The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

MCLG (Maximum Contaminant Level Goal): The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

MRDL (Maximum Residual Disinfectant Level): The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

MRDLG (Maximum Residual Disinfectant Level Goal): The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

NA: Not applicable.

pCi/L (picocuries per liter): A measure of radioactivity.

ppb (parts per billion): One part substance per billion parts water (or micrograms per liter).

ppm (parts per million): One part substance per million parts water (or milligrams per liter).
